

ABSTRACT

This study entails a framework on investigating childhood mortality in Kenya; factors leading to high mortality rates focusing on injury which has not been well exploited as a case in Kenya. Data for the research will be collected from Pumwani Maternity Hospital where questionnaires will be used and permissible documents holding the hospital records.

The study also has appealing findings on the reason as to why neonatal mortality at Pumwani Maternity Hospital in Kenya has not been fully handled with success. Health outcomes include post-delivery complications such as respiratory distress, asphyxia and premature births. A multi regression approach was conducted on the data in order to discuss the various factors and their effect on mortality.
