

# **MAASAI MARA UNIVERSITY**

## **REGULAR UNIVERSITY EXAMINATIONS**

## 2018/2019 ACADEMIC YEAR

### **EXAMINATION FOR THE DEGREE OF BACHELOR OF STATISTICS AND MATHEMATICS**

## COURSE CODE: STA 2221 COURSE TITLE: OPERATIONS RESEARCH II

DATE: 17<sup>TH</sup> APRIL 2019

TIME:1100-1300HRS

**INSTRUCTIONS:** 

**Answer Question ONE And ANY THREE questions** 

This paper consists of 5 printed pages. Please turn over.

#### **Question One**

1. A construction firm must complete a construction project comprised of 12 tasks, A-L. The firm of Engineers in consultation with Management has established the following dependencies and estimated durations.

Activity Code	Preceding activity	Duration	
			(Weeks)
А	-		6
В	-		7
С	-		6
D	A,B	l .	9
E	В		10
F	В, С		9
G	D		6
Н	D		4
Ι	F		3
J	E,G	,Ι	10
Κ	Н		9
L	F		8

#### **Required:**

- a) Draw the network and determine the critical path.
- b) Management is interested in saving a total of 3 weeks on the project completion time.

The following data have been collected

Activity	Possible Time Saving	Additional	
Week			Cost per (shs)
А	2		900
В	3		1500
С	1		1700
D	2		500
E	2		1400
G	1		2000
Н	2		2100
J	1		2500

#### **Required:**

What is the cheapest way to achieve the required time saving and what will be the additional cost incurred? (25 marks)

#### **Question Two**

2. The cost of transportation per unit from three sources and four destinations are given in the following table. Obtain the initial basic feasible solutions using the following methods. (15 marks)

i) North-West corner method

ii) Least cost method

iii) Vogel's approximation method

Source	Destination				Supply
	1	2	3	4	
1	4	2	7	3	250
2	3	7	5	8	450
3	9	4	3	1	500
Demand	200	400	300	300	1200

Transportation Model and Test for degeneracy

#### **Question Three**

A company produces three products A,B and C. Each product requires two raw materials: steel and aluminium. The following LP model describes the company's product mix problem.

And 
$$XA, XB, X_C \ge 0$$

The optimal production plan is given in the following table:

	Сј	→ 3	0	10	50	0	0
Basic variables	Unit profit	Quantity	X <sub>A</sub>	X <sub>B</sub>	X <sub>C</sub>	$S_1$	$S_2$
S <sub>1</sub>	0	150	3	-1	0	1	-1
X <sub>C</sub>	50	60	3/5	4/5	1	0	1/5
C <sub>j</sub> -Z <sub>j</sub>			0	- 30	0	0	-10

Where  $S_1$  and  $S_2$  are the slack variables for unused steel and aluminium quantity, respectively.

- a) Determine the optimal product mix and interpret your answer (5 marks)
- b) Determine and interpret the shadow prices of steel and aluminium

(2 marks)

- c) Suppose an additional 300 tonnes of Aluminium may be procured at a cost of \$ 100 per tonne. Should the company procure the additional aluminium? (3 marks)
- d) Unit profit of products A and B is \$ 30 and \$10 respectively. How much should this prices be increased so that products A and B are produced by the company? (5 marks)

#### **Question Four**

A team of 15 men is employed to unload lorries at a terminal. The team works a- 6 hour day during which 36 lorries arrive (i.e. 6 per hour) and it takes 7 ½ minutes to attend one lorry with the team acting as a single unit. Lorries are served on a FIFO basis. It has been estimated that the cost of keeping lorries waiting is \$6 per hour. Members of the teams are each paid \$ 2.50 per hour. It has been estimated that if the size of the team is increased to 20 men, the average service time would fall to 5 minutes.

#### **Required:**

Calculate the cost of the present system and the cost of the proposed system, and determine whether an increase in the size of the team would be justified on grounds of cost (15 marks)

#### **Question Five**

Best Sell Ltd has decided to launch a new product in addition to its range of products. The following information is available: (15 marks)

- i) The new product may be distributed through any combination of the two company warehouse  $W_1$  and  $W_2$ .
- The available monthly production capabilities for the new products are;
   1000 units at plant A
   2000 units at plant B
   1000 units at plant C
- iii) Three major concentration points of customer demand are at location E, F and G which are estimated to have a monthly demand of:
  900 units at plant E
  800 units at plant F
  900 units at plant G
- iv) The unit production costs amount to sh. 30, sh. 40, sh. 10 at A, B and C.
- v) The unit transportation costs from plant to warehouse and unit delivery cost from ware house to customers as shown below

Transportation cost schedule				
plants	W1	W2		
	Shs	Shs		
А	60	60		
В	50	50		
С	130	40		

Delivery costs schedule				
Warehouses	E Shs	F Shs	G Shs	
<b>W</b> <sub>1</sub>	30	60	80	
<b>W</b> <sub>2</sub>	5-	50	90	

Determine the optimum production and distribution schedule to minimize total costs.
